

0.1 Individual evaluation

A short evaluation of the project from each member in their own opinion. This is used to improve upcoming projects, to prevent making the same mistakes again.

Henrik: I really liked our project! :D I did not enjoy LaTeX :

Laura: Write here

Boti: This project was the most successful for me personally. My work was divided well between the different disciplines and still went in depth with most of them.

Felix: In this project I was able to fuse and apply the knowledge gathered from the previous semesters, resulting in better workflow and communication with the group. The initial idea of making an autonomous forklift was also a good fit in my opinion, as it gave a clear and defined goal and the task was more or less in an "let's see, if we can do this" approach. Combining working structures and group dynamics learned before made the whole environment pleasant. What I would change for the next project is to make finishing the requirements the first priority and then adapting the project around it. The troubles we had with the sensors or not having enough pins could have been tackled if attacked earlier.

Arthur: Participating in the project has been a valuable experience. I learnt through trial and error, how to design my own PCB. Boti, Felix and Henrik helped alot especially if I had any questions.

Casper: Write here
